RAIN WATER HARVESTING

Water Conservation

Date : ..06/03/2024..

Water is priceless gift given by nature and is an indispensable resource. It is a fundamental element for every life. Water conservation is an effort to prevent the scarcity of water. It is combination of different activities like preservation of water, prevention of water pollution. It also consists of control and development of water resources, both surface and ground water.

Rain water Harvesting

The Institution has implemented rainwater harvesting, which saves significant amount of water. The rainwater is allowed to go underground through the structures. Since the college well is much below the road level, water level rises in rainy season. Water collected from terrace by PVC pipe (4 inch pipe) outlet depends upon the area and number of pipes provided. Water is flowing through the pipes and drains in the rainwater harvesting pit. The drain wells are constructed for water collection & recharge of surrounding ground. Rain water pit is filled with gravels and sand for percolation of water for recharging the surrounding ground area. Total 3 numbers of 3'0" dia 5'0" depth rain water harvesting pit are available at the campus.
